

Subject: New Project Scope: Multi-Tenant Barber & Salon Booking SaaS Platform

Hi Team,

Following our SaaS strategy, we are introducing a similar platform tailored for barbering shops and beauty salons across Ghana. The goal is to eliminate long waiting times for clients and help shop owners manage their staff efficiently.

Just like the hostel project, every barber shop or salon will register and get a unique public booking link to share with their clients.

Please review the architectural requirements and feature sets below:

1. Core SaaS Architecture

- (a) Unique Shop Subdomains/Links: Every registered shop gets an instant, unique public link (e.g., cerkyl.com/book/gentlemens-cut).
- (b) Multi-Staff Profiles: The system must allow the shop owner (Admin) to create individual profiles for their employees (Barbers, Stylists, Nail Technicians).

2. External Client Booking Portal (The Unique Shop Link)

This is what the customer sees when they want to book a session.

- (a) Service Selection: A clean menu displaying services and prices (e.g., Haircut, Hair Dyeing, Braiding, Manicure).
- (b) Staff/Employer Selection: Clients must be able to choose their preferred barber or stylist. If they don't care who cuts their hair, they can select "Any Available Staff."
- (c) Real-Time Time-Slot Matrix: A live calendar showing available hours for that specific day.
- (d) Crucial Logic: If "Barber Kojo" is booked from 2:00 PM to 2:45 PM, the system must automatically block that slot for Kojo, but keep it open for other barbers in the shop.
- (e) Booking Options:
 - i. Book & Pay Instantly: Integration with Mobile Money (MTN, Telecel, AT) and Cards.

ii. Reserve & Pay at Shop: An option to lock the time slot and pay physically upon arrival, depending on the shop owner's preference.

3. Internal Shop Owner & Staff Dashboard (For the Barbers/Salons)

(a) Live Schedule Feed: A visual daily timeline for the owner to see who is booked, at what time, and by which client.

(b) Staff-Specific Logins: Individual barbers/stylists should be able to log in (via a simple mobile-responsive UI) to see only their personal schedule for the day.

(c) Push Notifications/SMS Alerts: Instant automated alerts (SMS or WhatsApp API) to the customer confirming their appointment, and a reminder 1 hour before their time slot.

Technical Focus Points for Next Discussion

When we sync on this, I want us to focus heavily on:

The Time-Slot Conflict Logic: Ensuring the database handles micro-bookings accurately so two clients can never accidentally book the same barber for the exact same time.

The "No-Show" Protection: Implementing a deposit or part-payment feature through the MoMo gateway so shops don't lose money if a client books a slot and fails to show up.

Please look over this and let's discuss how we can adapt the SaaS infrastructure we are using for the hostels to fit this appointment-based model.

Best regards,

Chris
